

SUMMARIZE AND LESSON LEARNED

This phase is to summarize the whole project, create the final report and list lesson learned.

Risks happened

1. Change in plan

- Member get their work done far before planned day.
- Estimated cost is more than real cost

2. Huge change in technical field

- Bad UI Design
- Bad Code architecture

3. Change in resource assignment

- Tester added to task Fix Bugs

Lesson learned

Cost management

- We pay for our member by time they worked, not by completion, this is because resource plan estimation based on time, and from time and hourly salary, we convert them to cost. This is a proper method because we calculated maximum time we spend for them to complete their task. But in this project's situation they work very hard and complete the task far ahead of time, so the cost has been reduced. But they work harder and they receive even lesser total salary, so we decided to pay the surplus money as reward for them.

Scope management

- The UI design and the logic code have been failed because we didn't test the design document, our tester just tested the code after they had coded. So this is a fault of planning, we need to assign QC for design document testing so that this issue won't happen again
